Customer retention and delivery performance report

1. Customer retention cohorts

The monthly cohort heatmap shows that repeat buying on the platform is almost none. In month zero, every acquired user placed an order. By month one, retention crashed to between 0.2% and 0.7% across all 2017 cohorts.

In short, they did not come back.

Through month twelve and into 2018, the numbers stayed flat between 0.0% and 0.5%. The highest retention point in the entire follow-up window was 0.7%, seen once at month twelve for the January cohort. Over 99% of people who bought an item in 2017 never placed a second order. The store runs on one-off sales rather than repeat visits.

2. Delivery time and customer review scores

State-level shipping speeds show a statistically significant negative link with customer ratings.

The Pearson correlation coefficient is -0.4861 with a p-value of 0.0102. The Spearman rank correlation is -0.4383 with a p-value of 0.0222. Both p-values sit well below the standard alpha = 0.05 cutoff, which we can 95% confidently confirm the pattern is real.

When packages take longer to arrive, average review scores drop. States with long shipping times consistently hand out lower ratings than states close to providers. Slower deliveries tend to negatively affect seller reviews across the map.
